

EGEE-JRA1 IT/CZ meeting, Milan, December 14-15, 2004

Enabling Grids for  
E-science in Europe

[www.eu-egee.org](http://www.eu-egee.org)

# CESNET Report

# LB Proxy—Current state

- The basic functionality is ready to use—could start integration
- Producer and consumer API—both using UNIX socket
- Sequence code management
- Forwarding events to a proper LB server(s)
- Client API examples (both producer and consumer)

# LB Proxy—to be done

- Job registration (temporary done by old style synchronous calls)
- Automated purge/clean strategy
- When exactly can we purge the job data? (in state DONE\_OK or ABORT, after given time out)
- Release RPMs—potential problem with two sets of RPM packages from one (lbserver) module?
- All the behavior should be tested more thoroughly with workload manager

- Available in gLite CVS
  - integration into build system could be starte
- Existing WSDL's (please have a look at it)
- Besides its availability, JP requires lot of testing and further development

# Job Provenance—integration with WMS and LB

- Approach to be used to feed JP by LB (NS)
  - which JP should be used?
  - "fallback" JP for every LB server
  - use user tags to give a JP location—should be stored in a job state also

# Job Provenance—future plans

- Deploy integrated version as soon as possible
- Use Server Bones library and WS plugin
- FTP authorization
- Negotiate the strategies for purging data stores
- Deploy User Interface (not a priority now, probably after a review)

- We started with documentation generation from source code via doxygen
- Very first version—more feedback needed
- Doxygen and its tools are not in repository
- The present situation—open issues
  - it is not clear, what should be done next
  - the place for generated documentation not known
  - the format of documentation is not known
  - any method for automatic generation not given

# Fake library

- Substitute library designed for usage in unit tests
- Implements a subset of LB client API
- Enables to adjust returned data (callbacks definitions)
- More detailed documentation in [org.glite.lb/client/doc/README-fake](http://org.glite.lb/client/doc/README-fake)
- Example of use in [org.glite.lb/client/test/job\\_log\\_fake.cpp](http://org.glite.lb/client/test/job_log_fake.cpp)

# Short overview

- Tagged RC1 branch
- Notification (HOLUB) service
  - race condition in interlogger fixed
  - it has been shown that cover tests are needed
