EGEE NA3 Training & Dissemination
CYCLOPS Second Training Workshop
Chania (Crete), 05th-07th May 2008

Outline

- Grid Data Management Challenge
- Storage Elements and SRM
- File Catalogs and DM tools
- File Transfer Service

The Grid DM Challenge

The Grid DM Challenge

- Heterogeneity

The Grid DM Challenge

- **Heterogeneity**
 - Data are stored on different storage systems using different access technologies

The Grid DM Challenge

- **Heterogeneity**
 - Data are stored on different storage systems using different access technologies
- **Distribution**

The Grid DM Challenge

- **Heterogeneity**
 - Data are stored on different storage systems using different access technologies
- **Distribution**
 - Data are stored in different locations – in most cases there is no shared file system or common namespace

CYCLOPS

The Grid DM Challenge

- **Heterogeneity**
 - Data are stored on different storage systems using different access technologies
- **Distribution**
 - Data are stored in different locations – in most cases there is no shared file system or common namespace
 - Data need to be moved between different locations

The Grid DM Challenge

Introduction

CYCLOPS

Introduction

- Assumptions:
 - Users and programs produce and require data
 - the lowest granularity of the data is on the file level (we deal with files rather than data objects or tables)
 - Data = files

CYCLOPS

Introduction

- Assumptions:
 - Users and programs produce and require data
 - the lowest granularity of the data is on the file level (we deal with files rather than data objects or tables)
 - Data = files
- Files:
 - Mostly, write once, read many
 - Located in Storage Elements (SEs)
 - Several replicas of one file in different sites
 - Accessible by Grid users and applications from “anywhere”
 - Locatable by the WMS (data requirements in JDL)

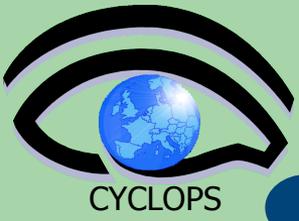

CYCLOPS

Introduction

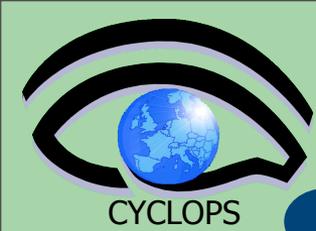

- Assumptions:
 - Users and programs produce and require data
 - the lowest granularity of the data is on the file level (we deal with files rather than data objects or tables)
 - Data = files
- Files:
 - Mostly, write once, read many
 - Located in Storage Elements (SEs)
 - Several replicas of one file in different sites
 - Accessible by Grid users and applications from “anywhere”
 - Locatable by the WMS (data requirements in JDL)
- Also...
 - WMS can send (small amounts of) data to/from jobs: Input and Output Sandbox
 - Files may be copied from/to local filesystems (WNs, UIs) to the Grid (SEs)

gLite Grid Storage Requirements

gLite Grid Storage Requirements

- The **Storage Element** is the service which allow a user or an application to store data for future retrieval

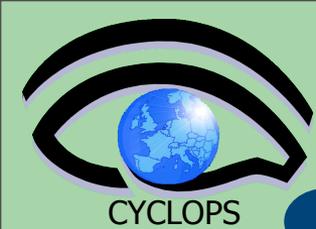

gLite Grid Storage Requirements

- The **Storage Element** is the service which allow a user or an application to store data for future retrieval

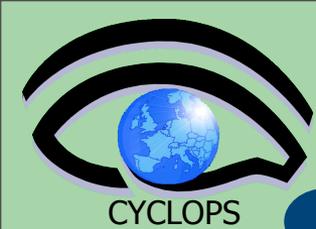

gLite Grid Storage Requirements

- The **Storage Element** is the service which allow a user or an application to store data for future retrieval
- Manage local storage (disks) and interface to Mass Storage Systems(tapes) like
 - HPSS, CASTOR, DiskeXtender (UNITREE), ...

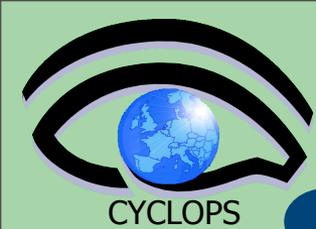

CYCLOPS

gLite Grid Storage Requirements

- The **Storage Element** is the service which allow a user or an application to store data for future retrieval
- Manage local storage (disks) and interface to Mass Storage Systems(tapes) like
 - HPSS, CASTOR, DiskeXtender (UNITREE), ...

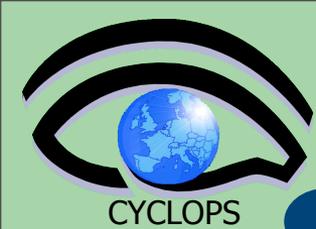

gLite Grid Storage Requirements

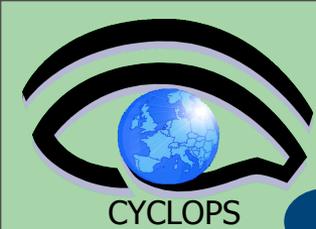

- The **Storage Element** is the service which allow a user or an application to store data for future retrieval
- Manage local storage (disks) and interface to Mass Storage Systems(tapes) like
 - HPSS, CASTOR, DiskeXtender (UNITREE), ...
- Be able to manage different storage systems uniformly and transparently for the user (providing an SRM interface)

gLite Grid Storage Requirements

- The **Storage Element** is the service which allow a user or an application to store data for future retrieval
- Manage local storage (disks) and interface to Mass Storage Systems(tapes) like

- Manage local storage (disks) and interface to Mass Storage Systems(tapes) like
 - HPSS, CASTOR, DiskeXtender (UNITREE), ...
- Be able to manage different storage systems uniformly and transparently for the user (providing an SRM interface)
- Support basic file transfer protocols
 - GridFTP mandatory
 - Others if available (https, ftp, etc)

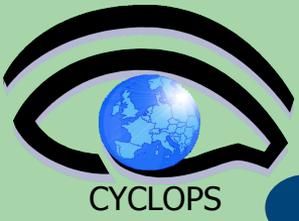

CYCLOPS

gLite Grid Storage Requirements

- The **Storage Element** is the service which allow a user or an application to store data for future retrieval
- Manage local storage (disks) and interface to Mass Storage Systems(tapes) like
 - HPSS, CASTOR, DiskeXtender (UNITREE), ...
- Be able to manage different storage systems uniformly and transparently for the user (providing an SRM interface)
- Support basic file transfer protocols
 - GridFTP mandatory
 - Others if available (https, ftp, etc)
- Support a native I/O (remote file) access protocol
 - POSIX (like) I/O client library for direct access of data (GFAL)

SRM in an example

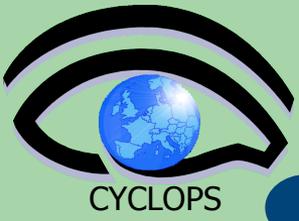

She is running a job which needs:
Data for physics event reconstruction
Simulated Data
Some data analysis files
She will write files remotely too

They are at CERN
In dCache

They are at Fermilab
In a disk array

They are at Nikhef
in a classic SE

SRM in an example

dCache

Own system, own protocols
and parameters

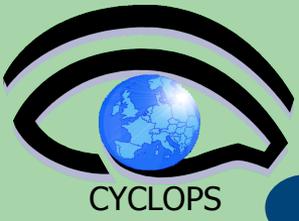

gLite DPM

Independent system from
dCache or Castor

Castor

No connection with
dCache or DPM

You as a
user need
to know all
the
systems!!!

SRM in an example

dCache

Own system, own protocols and parameters

gLite DPM

Independent system from dCache or Castor

Castor

No connection with dCache or DPM

SRM

I talk to them on your behalf
I will even allocate space for your files
And I will use transfer protocols to send your files there

Storage Resource Management

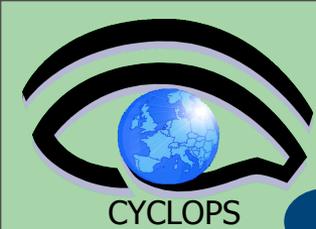

Storage Resource Management

- Data are stored on **disk pool servers** or **Mass Storage Systems**

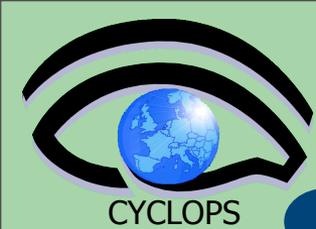

Storage Resource Management

- Data are stored on **disk pool servers** or **Mass Storage Systems**
- storage resource management needs to take into account
 - Transparent access to files (migration to/from disk pool)
 - File pinning
 - Space reservation
 - File status notification
 - Life time management

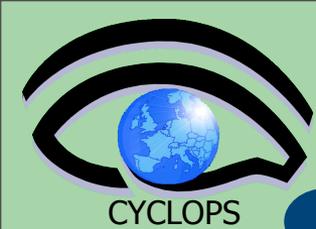

Storage Resource Management

- Data are stored on **disk pool servers** or **Mass Storage Systems**
- storage resource management needs to take into account
 - Transparent access to files (migration to/from disk pool)
 - File pinning
 - Space reservation
 - File status notification
 - Life time management
- **The SRM (Storage Resource Manager)** takes care of all these details
 - The SRM is a single interface that takes care of local storage interaction and provides a Grid

Storage Resource Management

- Data are stored on **disk pool servers** or **Mass Storage Systems**
- storage resource management needs to take into account
 - Transparent access to files (migration to/from disk pool)
 - File pinning
 - Space reservation
 - File status notification
 - Life time management
- **The SRM (Storage Resource Manager)** takes care of all these details
 - The SRM is a single interface that takes care of local storage interaction and provides a Grid
- In gLite, interactions with the SRM is hidden by higher level services (DM tools and APIs)

CYCLOPS

gLite SE types

- gLite 3.0 data access protocols:
 - File Transfer: **GSIFTP (GridFTP)**
 - File I/O (Remote File access):
 - **gsidcap**
 - **insecure RFIO**
 - **secured RFIO (gsirfio)**
- **Classic SE:**
 - GridFTP server
 - Insecure RFIO daemon (rfiod) – only LAN limited file access
 - Single disk or disk array
 - No quota management
 - Does not support the SRM interface

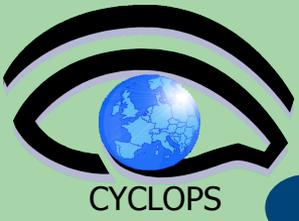

CYCLOPS

gLite SE types (II)

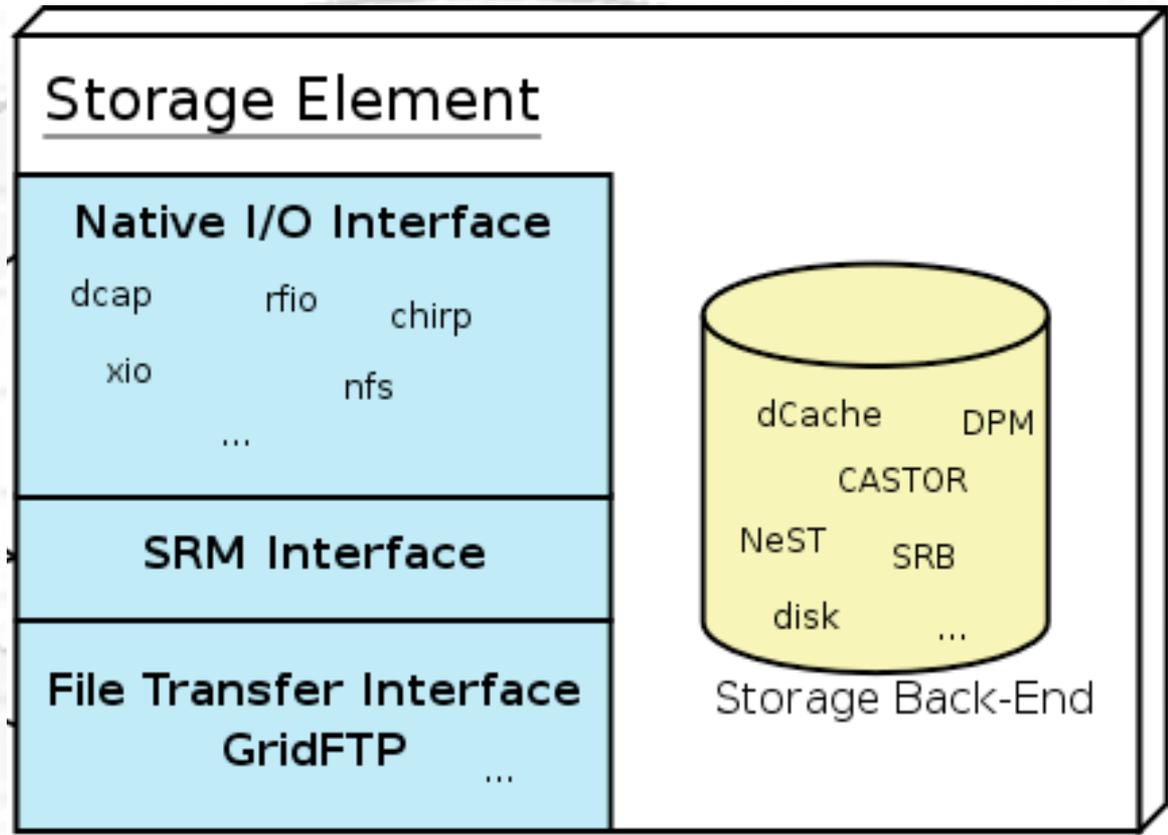

- **Mass Storage Systems (Castor)**
 - Files migrated between front-end disk and back-end tape storage hierarchies
 - GridFTP server
 - Insecure RFIO (Castor)
 - Provide a SRM interface with all the benefits
- **Disk pool managers (dCache and gLite DPM)**
 - manage distributed storage servers in a centralized way
 - Physical disks or arrays are combined into a common (virtual) file system
 - Disks can be dynamically added to the pool
 - GridFTP server
 - Secure remote access protocols (gsidcap for dCache, gsirfio for DPM)
 - SRM interface

Information Society
and Media

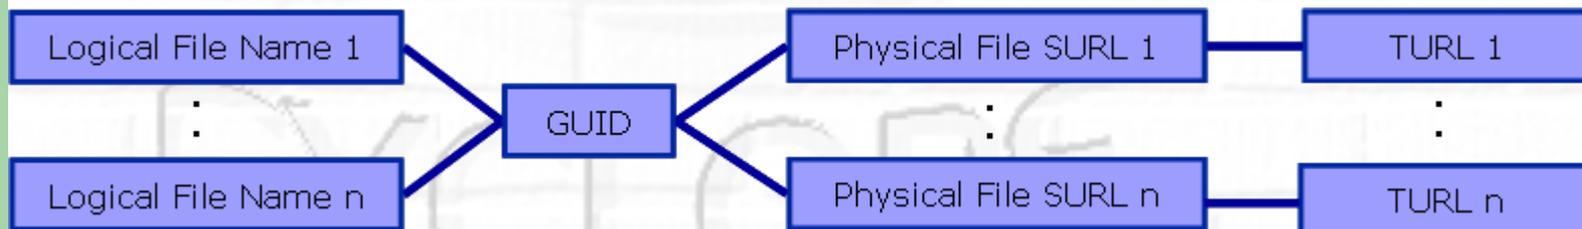

gLite Storage Element

Files Naming conventions

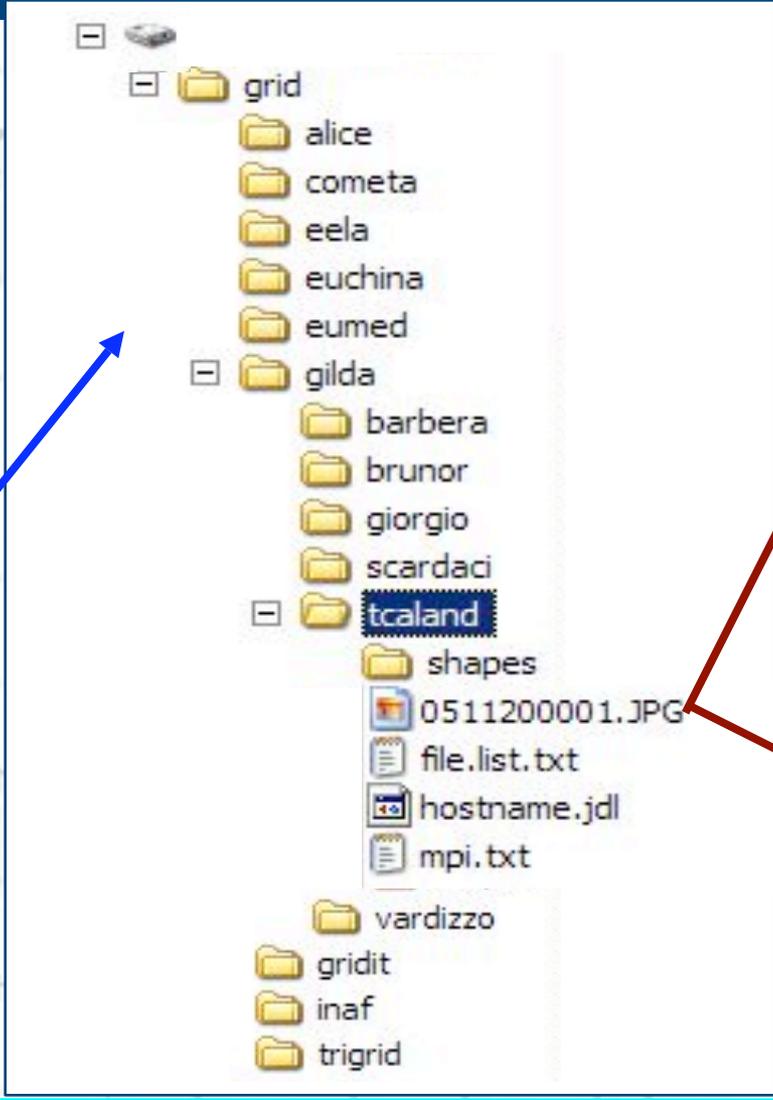

- **Logical File Name (LFN)**
 - An alias created by a user to refer to some item of data, e.g. “lfn:/grid/gilda/20030203/run2/track1”
- **Globally Unique Identifier (GUID)**
 - A non-human-readable unique identifier for an item of data, e.g. “guid:f81d4fae-7dec-11d0-a765-00a0c91e6bf6”
- **Site URL (SURL) (or Physical File Name (PFN) or Site FN)**
 - The location of an actual piece of data on a storage system
e.g. “srm://grid009.ct.infn.it/dpm/ct.infn.it/gilda/output10_1” (SRM) “sfn://lxshare0209.cern.ch/data/alice/ntuples.dat” (Classic SE)
- **Transport URL (TURL)**
 - Temporary locator of a replica + access protocol: understood by a SE, e.g.
“rfio://lxshare0209.cern.ch//data/alice/ntuples.dat”

What is a file catalog

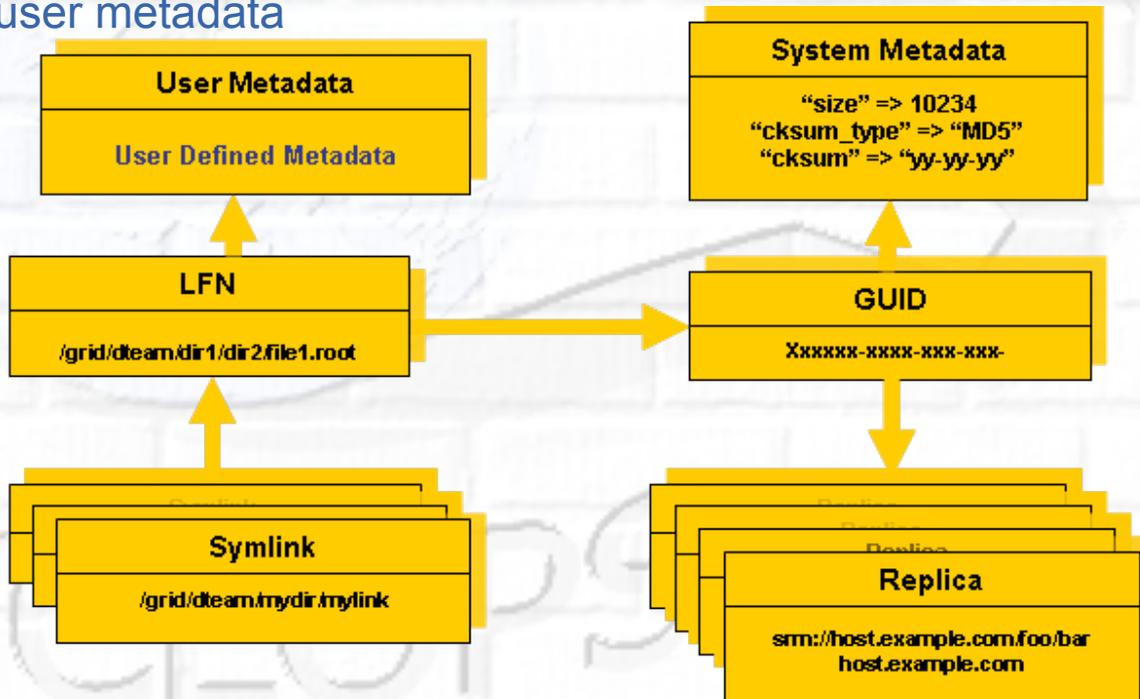

File Catalog

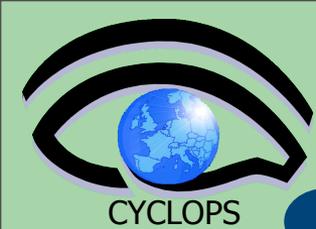

The LFC (LCG File Catalog)

- It keeps track of the location of copies (replicas) of Grid files
- LFN acts as main key in the database. It has:
 - Symbolic links to it (additional LFNs)
 - Unique Identifier (GUID)
 - System metadata
 - Information on replicas
 - One field of user metadata

LFC Features

- Cursors for large queries
- Timeouts and retries from the client
- User exposed transactional API (+ auto rollback on failure)
- **Hierarchical namespace** and namespace operations (for LFNs)
- Integrated GSI Authentication + Authorization
- Access Control Lists (Unix Permissions and POSIX ACLs)
- Checksums
- Integration with VOMS (VirtualID and VirtualGID)

CYCLOPS

LFC commands

Summary of the LFC Catalog commands

lfc-chmod	Change access mode of the LFC file/directory
lfc-chown	Change owner and group of the LFC file-directory
lfc-delcomment	Delete the comment associated with the file/directory
lfc-getacl	Get file/directory access control lists
lfc-ln	Make a symbolic link to a file/directory
lfc-ls	List file/directory entries in a directory
lfc-mkdir	Create a directory
lfc-rename	Rename a file/directory
lfc-rm	Remove a file/directory
lfc-setacl	Set file/directory access control lists
lfc-setcomment	Add/replace a comment

Information Society
and Media

Listing the entries of a LFC directory

```
lfc-ls [-cdiLIRTu] [--class] [--comment] [--deleted] [--display_side] [--ds]
  path...
```

where *path* specifies the LFN pathname (mandatory)

- Remember that **LFC has a directory tree structure**
- **/grid/<VO_name>/<you create it>**

- All members of a VO have read-write permissions under their directory
- You can set LFC_HOME to use relative paths

-l : long listing
-R : list the contents of directories recursively: **Don't use it!**

CYCLOPS

lfc-mkdir

Creating directories in the LFC

lfc-mkdir [-m mode] [-p] path...

- Where *path* specifies the LFC pathname
- Remember that while registering a new file (using `lfc-cr`, for example) the corresponding destination directory must be created in the catalog beforehand.
- Examples:
 - > ***lfc-mkdir /grid/gilda/tony/demo***

You can just check the directory with:

> **`lfc-ls -l /grid/gilda/tony`**

```
drwxr-xrwx  0 19122  1077          0 Jun 14 11:36 demo
```

Information Society
and Media

Creating a symbolic link

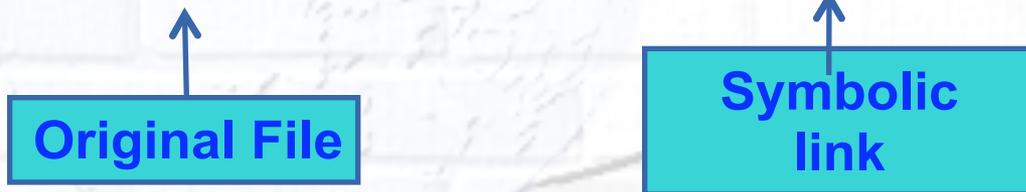

lfc-ln -s file linkname

lfc-ln -s directory linkname

Create a link to the specified *file* or *directory* with *linkname*

– *Examples:*

```
> lfc-ln -s /grid/gilda/tony/demo/test /grid/gilda/tony/aLink
```

Let's check the link using `lfc-ls` with long listing (`-l`):

```
> lfc-ls -l
```

```
lrwxrwxrwx 1 19122 1077 0 Jun 14 11:58 aLink ->/grid/gilda/tony/demo/test
```

```
drwxr-xrwx 1 19122 1077 0 Jun 14 11:39 demo
```

CYCLOPS

LFC C API

Low level methods (many POSIX-like):

lfc_access	lfc_deleteclass	lfc_listreplica	lfc_setacl
lfc_aborttrans	lfc_delreplica	lfc_lstat	lfc_setatime
lfc_addreplica	lfc_endtrans	lfc_mkdir	lfc_setcomment
lfc_apiinit	lfc_enterclass	lfc_modifyclass	lfc_seterrbuf
lfc_chclass	lfc_errmsg	lfc_opendir	lfc_setfszsize
lfc_chdir	lfc_getacl	lfc_queryclass	lfc_starttrans
lfc_chmod	lfc_getcomment	lfc_readdir	lfc_stat
lfc_chown	lfc_getcwd	lfc_readlink	lfc_symlink
lfc_closedir	lfc_getpath	lfc_rename	lfc_umask
lfc_creat	lfc_lchown	lfc_rewind	lfc_undelete
lfc_delcomment	lfc_listclass	lfc_rmdir	lfc_unlink
lfc_delete	lfc_listlinks	lfc_selectsrvr	lfc_utime
			send2lfc

CYCLOPS

GFAL: Grid File Access

Interactions with SE require some components:

- File catalog services to locate replicas
- SRM
- File access mechanism to access files from the SE on the WN

GFAL does all this tasks for you:

- Hides all these operations
- Presents a POSIX interface for the I/O operations
 - Single shared library in threaded and unthreaded versions
`libgfal.so`, `libgfal_pthr.so`
 - Single header file: `gfal_api.h`
- User can create all commands needed for storage management
- It offers as well an interface to SRM

Supported protocols:

- file (local or nfs-like access)
- dcap, gsidcap and kdcap (dCache access)
- rfio (castor access) and gsirfio (dpm)

CYCLOPS

GFAL: File I/O API (I)

```
int gfal_access (const char *path, int amode);
int gfal_chmod (const char *path, mode_t mode);
int gfal_close (int fd);
int gfal_creat (const char *filename, mode_t mode);
off_t gfal_lseek (int fd, off_t offset, int whence);
int gfal_open (const char * filename, int flags, mode_t mode);
ssize_t gfal_read (int fd, void *buf, size_t size);
int gfal_rename (const char *old_name, const char *new_name);
ssize_t gfal_setfilchg (int, const void *, size_t);
int gfal_stat (const char *filename, struct stat *statbuf);
int gfal_unlink (const char *filename);
ssize_t gfal_write (int fd, const void *buf, size_t size);
```

CYCLOPS

GFAL: File I/O API (II)

```
int gfal_closedir (DIR *dirp);  
int gfal_mkdir (const char *dirname, mode_t mode);  
DIR *gfal_opendir (const char *dirname);  
struct dirent *gfal_readdir (DIR *dirp);  
int gfal_rmdir (const char *dirname);
```

CYCLOPS

GFAL: Catalog API

```
int create_alias (const char *guid, const char *lfn, long long
size)
int guid_exists (const char *guid)
char *guidforpfn (const char *surl)
char *guidfromlfn (const char *lfn)
char **lfnforguid (const char *guid)
int register_alias (const char *guid, const char *lfn)
int register_pfn (const char *guid, const char *surl)
int setfilesize (const char *surl, long long size)
char *surlfromguid (const char *guid)
char **surlsfromguid (const char *guid)
int unregister_alias (const char *guid, const char *lfn)
int unregister_pfn (const char *guid, const char *surl)
```

CYCLOPS

GFAL: Storage API

int **deletesurl** (const char *surl)

int **getfilemd** (const char *surl, struct stat64 *statbuf)

int **set_xfer_done** (const char *surl, int reqid, int fileid, char *token, int oflag)

int **set_xfer_running** (const char *surl, int reqid, int fileid, char *token)

char ***turlfromsurl** (const char *surl, char **protocols, int oflag, int *reqid, int *fileid, char **token)

int **srm_get** (int nbfiles, char **surls, int nbprotocols, char **protocols, int *reqid, char **token, struct srm_filestatus **filestatuses)

int **srm_getstatus** (int nbfiles, char **surls, int reqid, char *token, struct srm_filestatus **filestatuses)

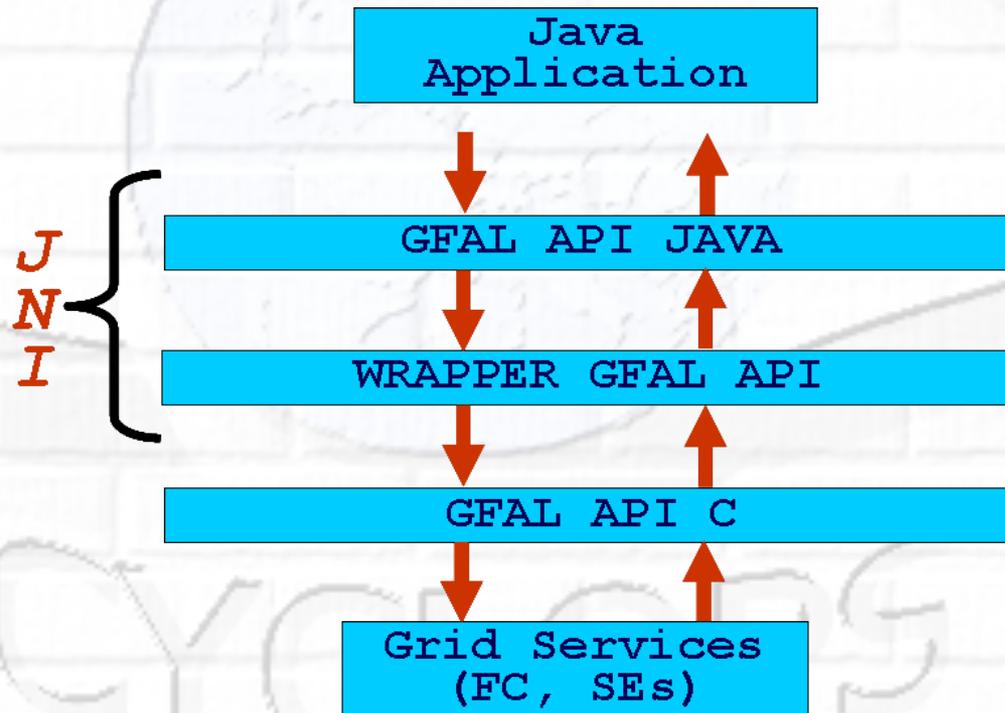

CYCLOPS

GFAL Java API

- GFAL API are available for C/C++ programmers
- We wrote a wrapper around the C APIs using Java Native Interface and a the Java APIs on top of it
- More information can be found here:

<https://grid.ct.infn.it/twiki/bin/view/GILDA/APIGFAL>

CYCLOPS

lcg-utils DM tools

- High level interface (CL tools and APIs) to
 - Upload/download files to/from the Grid (UI,CE and WN <----> SEs)
 - Replicate data between SEs and locate the best replica available
 - Interact with the file catalog
- **Definition:** A file is considered to be a **Grid File** if it is both physically present in a SE and registered in the File Catalog
- lcg-utils ensure the consistency between files in the Storage Elements and entries in the File Catalog

CYCLOPS

lcg-utils commands

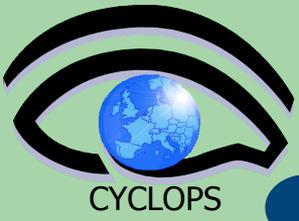

Replica Management

lcg-cp	Copies a grid file to a local destination
lcg-cr	Copies a file to a SE and registers the file in the catalog
lcg-del	Delete one file
lcg-rep	Replication between SEs and registration of the replica
lcg-gt	Gets the TURL for a given SURL and transfer protocol
lcg-sd	Sets file status to “Done” for a given SURL in a SRM request

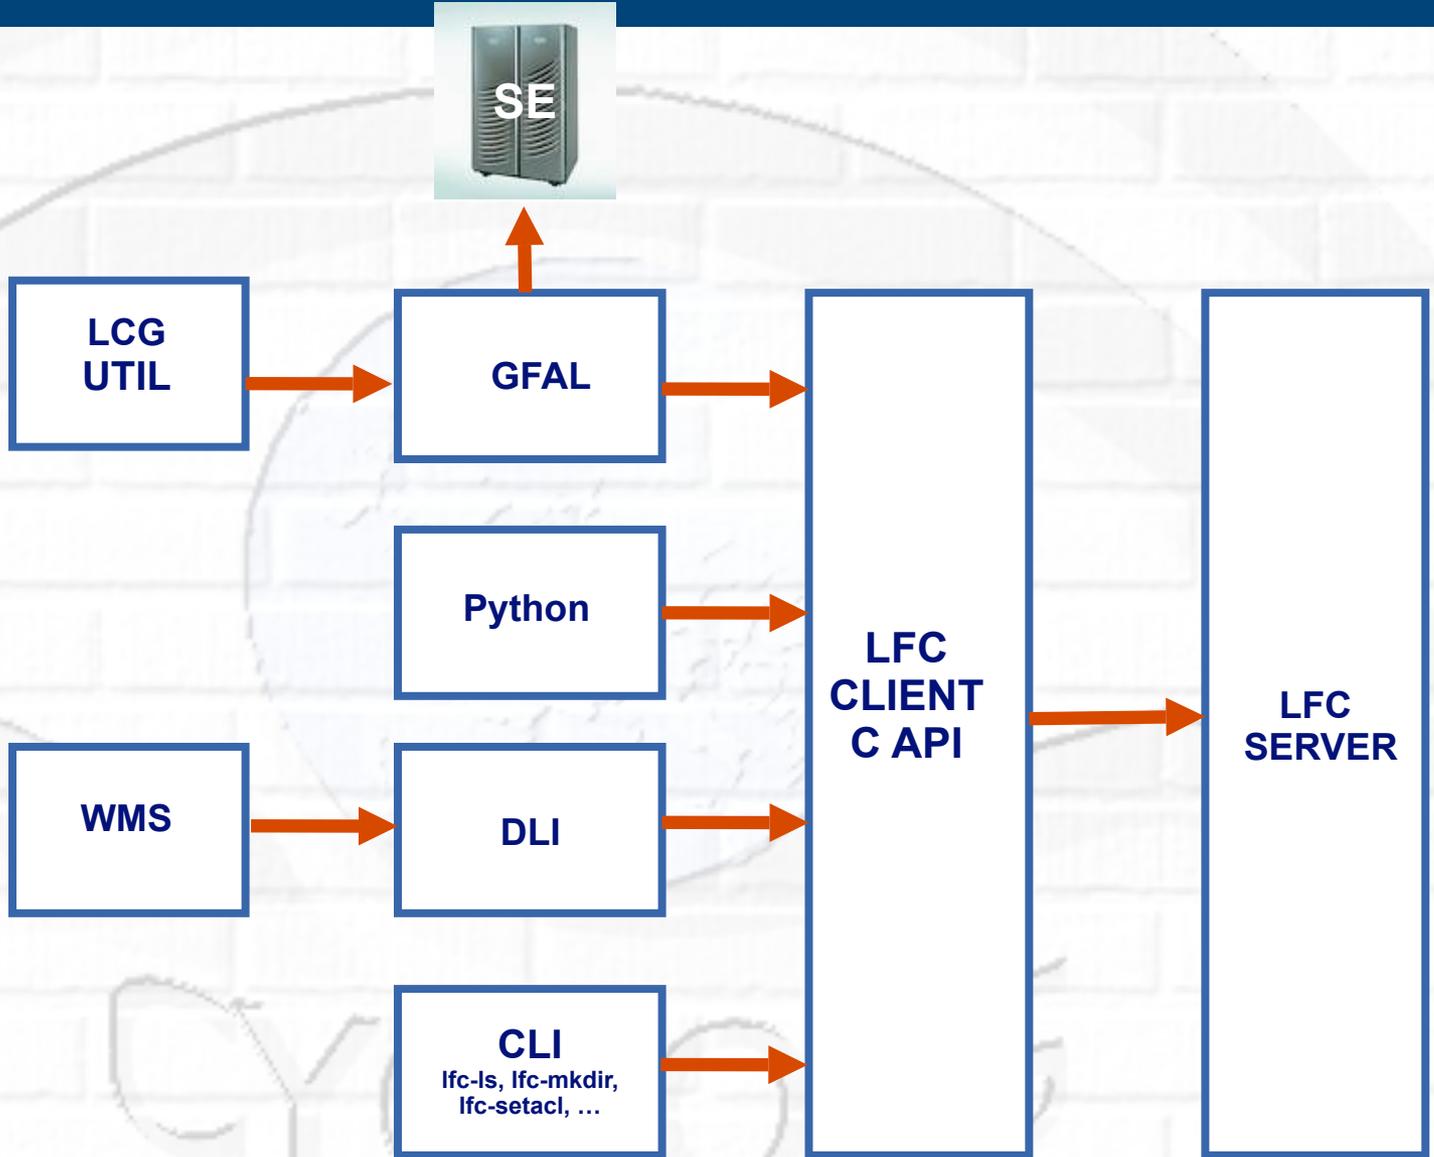

File Catalog Interaction

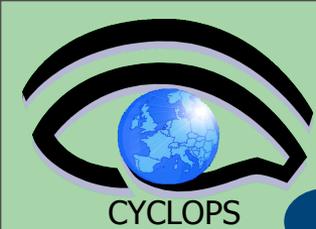

lcg-aa	Add an alias in LFC for a given GUID
lcg-ra	Remove an alias in LFC for a given GUID
lcg-rf	Registers in LFC a file placed in a SE
lcg-uf	Unregisters in LFC a file placed in a SE
lcg-la	Lists the alias for a given SURL, GUID or LFN
lcg-lg	Get the GUID for a given LFN or SURL
lcg-lr	Lists the replicas for a given GUID, SURL or LFN

LFC interfaces

Data movement introduction

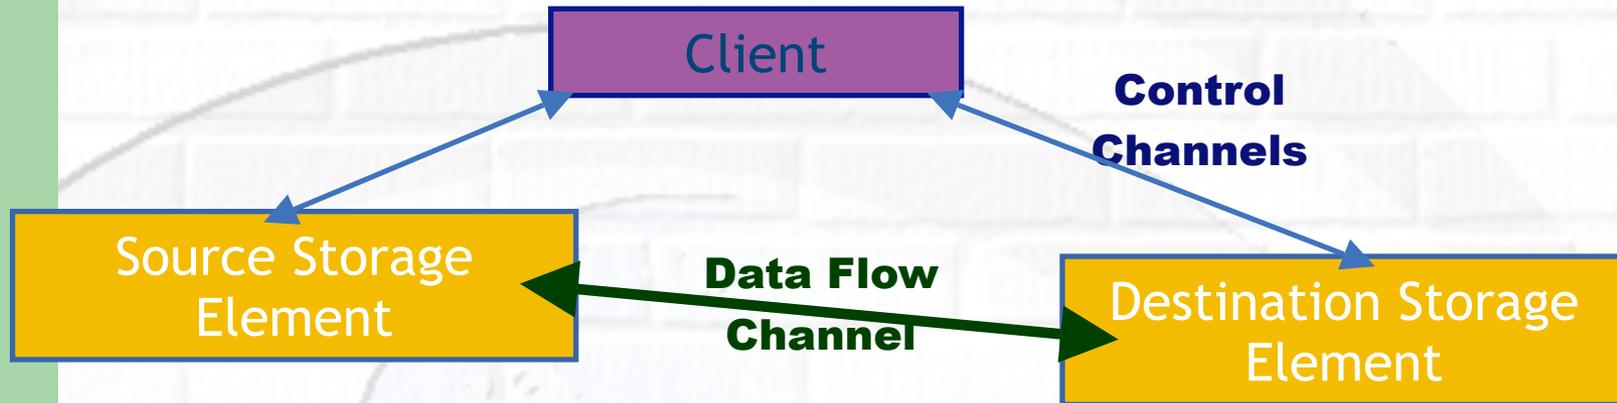

- Grids are naturally distributed systems
- The means that data also needs to be distributed
 - First generation data distribution mainly concentrated on copy protocols in a grid environment:
 - gridftp
 - http + mod_gridsite
- But copies controlled by clients have problems...

CYCLOPS

Direct Client Controlled Data Movement

- Although transport protocol may be robust, state is held inside client – inconvenient and fragile.
- Client only knows about local state, no sense of global knowledge about data transfers between storage elements.
 - Storage elements overwhelmed with replication requests
 - Multiple replications of the same data can happen simultaneously
 - Site has little control over balance of network resources - DOS

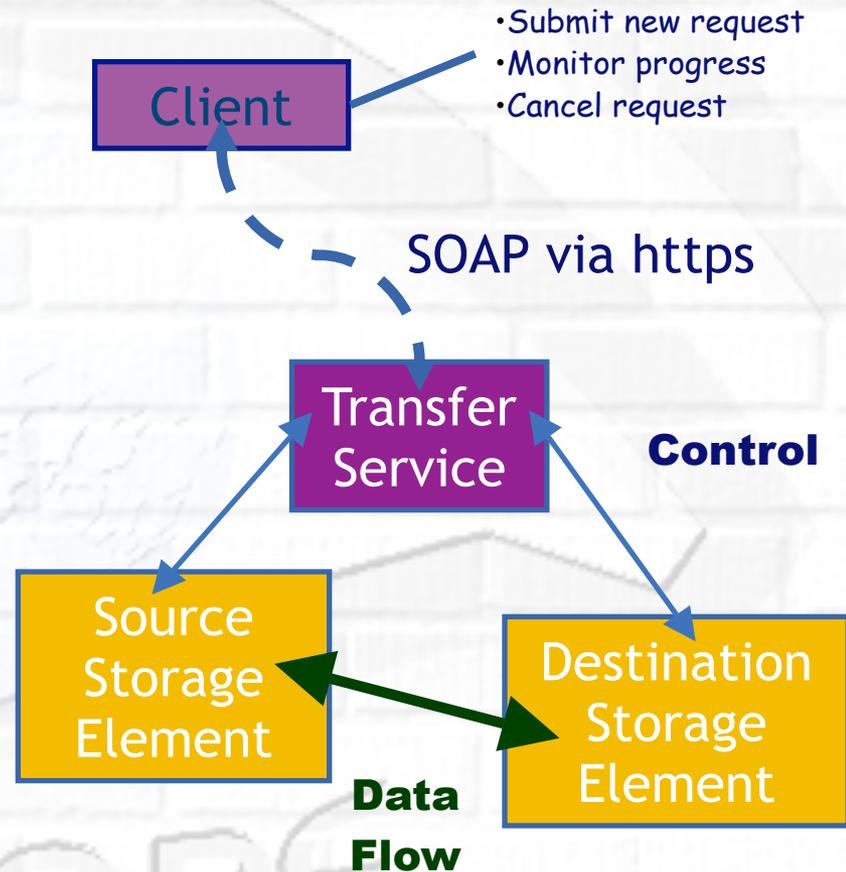

Information Society
and Media

CYCLOPS

Transfer Service

- Clear need for a **service** for data transfer
 - Client connects to service to submit request
 - Service maintains state about transfer
 - Client can periodically reconnect to check status or cancel request
 - Service can have knowledge of global state, not just a single request
 - Load balancing
 - Scheduling

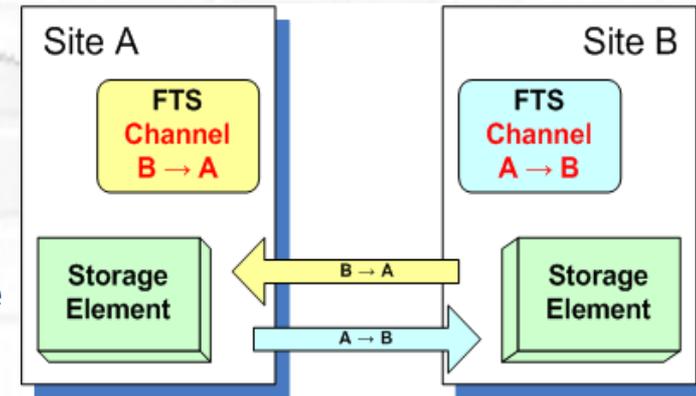

CYCLOPS

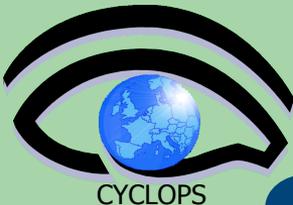

gLite FTS: Channels

- FTS Service has a concept of **channels**
- A channel is a **unidirectional** connection between two sites
- Transfer requests between these two sites are assigned to that channel
- Channels usually correspond to a dedicated network pipe (e.g., OPN) associated with production
- But channels can also take wildcards:
 - * to MY_SITE : All incoming
 - MY SITE to * : All outgoing
 - * to * : Catch all

- Channels control certain transfer properties: transfer concurrency, gridftp streams.
- Channels can be controlled independently: started, stopped, drained.

Data Management Services Summary

- **Storage Element** – save data and provide a common interface
 - Storage Resource Manager (SRM) Castor, dCache, DPM, ...
 - Native Access protocols rfiio, dcap, nfs, ...
 - Transfer protocols gsiftp, ftp, ...
- **Catalogs** – keep track where data are stored
 - File Catalog
 - Replica Catalog
 - Metadata Catalog

LCG File Catalog (LFC)

AMGA Metadata Catalogue
- **Data Movement** – schedules reliable file transfer
 - File Transfer Service gLite FTS
(manages physical transfers)
